## Cohorts testing for anti-HCV in Russia

1. Blood, organ and tissue donors
2. Pregnant women
3. The staff of medical institutions
4. Patients in centers and departments of hemodialysis, kidney transplant, cardiovascular and pulmonary surgery, hematology
5. Patients before admission to planned surgery, before chemotherapy
6. Patients with chronic diseases, including liver damage
7. Patients with HBV, HIV, TB, STI
8. Persons at risk for hepatitis C infection (PWID, prisoners, sex workers)

# Confirmation of the diagnosis of hepatitis C in Russia

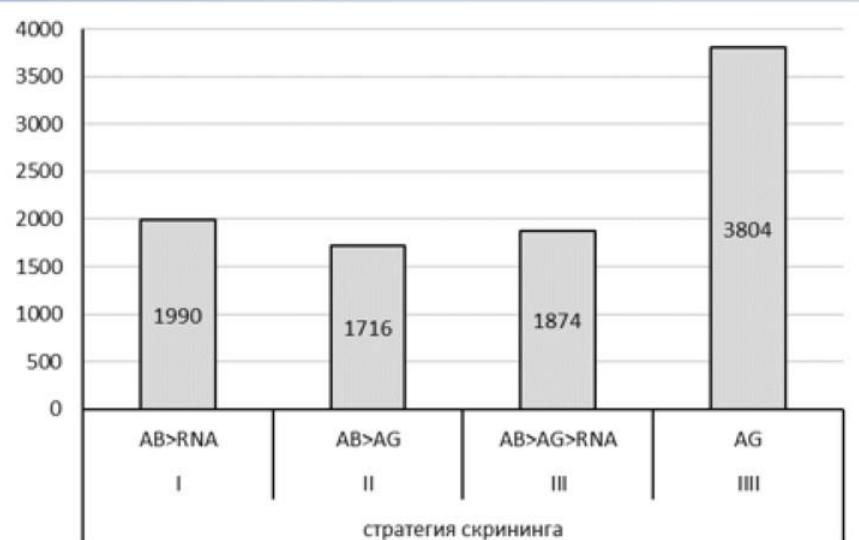

# Recommendations for laboratory examination of persons with anti-HCV (Tillmann H.)

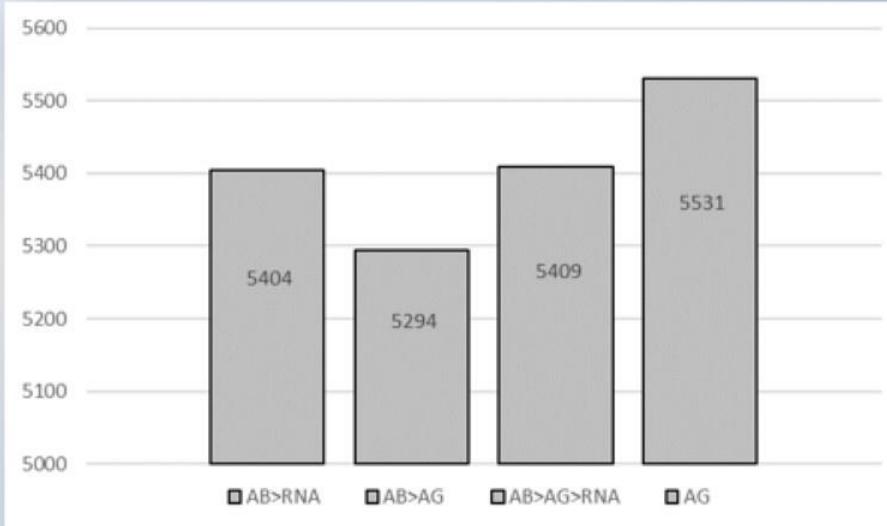

# Comparison of the cost-effectiveness of different hepatitis C screening strategies in high-prevalence settings

The cost of testing 100 000 people (x1000\$)

The number of identified cases of infection

# Conclusion

- In recent years, the incidence of hepatitis C in Russia has been declining;
- Estimated number of patients with chronic hepatitis C in Russia reaches 4.9 million;
- Chronic hepatitis C is the main cause of liver cirrhosis (except alcohol etiology) and hepatocellular carcinoma in Russia;
- There is a tendency to an increase in mortality and mortality from liver cirrhosis and hepatocellular carcinoma;
- To reduce the burden of hepatitis C in Russia, it is necessary to provide all patients with chronic hepatitis C with diagnosis and treatment.
